Movable types of clay were in use in China in the 11th century, and were followed by tin types, strung on a wire, and by individual wooden types (a kind still widely used). Type made from metal, cast molten into a matrix and cooled (essentially the process by which most modern type is made), was known in Europe in the 15th century. Early European type makers produced much black letter, but this declined in favor of more readable faces, notable examples being the old style of William Caslon, and the prototypal "modern" faces of Giambattista Bodoni, both of the 18th century. Notable American contributions are Cheltenham and Goudy. Modern advertising typography has developed a profusion of styles. See **POINT SYSTEM**.

The following table shows the old names and the sizes of type used in bookwork; the black squares show the sizes of the corresponding em quad, and the numbers refer to the nearest equivalent in the American point system.

| Name         | Specimen                   | Em quad   | Point |

*Excellior* (3-point type) and *brilliant* (3 1/4-point) are seldom used. Today, type sizes are almost universally indicated in points, as 8, 12, 18, 24, 36, 48, 60-point, etc. The standard height of type, technically called *height-to-paper*, is 0.9186 of an inch. According to its width, type is described as *standard* or *normal*, *condensed*, *extra condensed*, and *extended*.

standard condensed  
extra-condensed extended

The weight of a type face (lightness or heaviness of tone) is stated as *standard*, *lightface*, *boldface*, *extrabold*.

## III. CHEMISTRY

- + signifies "plus," "and," "together with," and is used between the symbols of substances brought together for, or produced by, a reaction. Placed above a symbol or to its right above the line, it signifies a unit charge of positive electricity. Thus:  $\text{Ca}^{++}$  denotes the ion of calcium, which carries two positive charges. The plus sign is also used to indicate dextrorotation; as,  $+143^\circ$ . It is sometimes used to indicate a base or alkalioid, when placed above the initial letter of the name of the substance; as,  $\overset{+}{M}$ , morphine;  $\overset{+}{Q}$ , quinine.  
 — signifies a single "bond," or unit of attractive force or affinity, and is used between the symbols of elements or groups which unite to form a compound; thus,  $\text{H}-\text{Cl}$  for  $\text{HCl}$ ,  $\text{H}-\text{O}-\text{H}$  for  $\text{H}_2\text{O}$ . Placed above a symbol, or to its right above the line, it signifies a unit charge of negative electricity; thus,  $\text{Cl}^-$  denotes a chlorine ion carrying a negative charge. The dash indicates levorotation; as,  $-92^\circ$ . It also indicates an acid, when placed above the initial letter of the name of the acid; as,  $\overset{-}{C}$ , citric acid. It is also used to indicate the removal of a part from a compound.  
 — often indicates valence; as,  $\text{Fe}^{II}$  denotes bi-

valent iron;  $\text{Fe}^{III}$ , trivalent iron. Sometimes its use is restricted to negative ions, so that it is equivalent to —.  
 . is often used: (1) To indicate a bond; as,  $\text{H}\cdot\text{Cl}$  for  $\text{H}-\text{Cl}$ . (2) To denote a unit positive charge of electricity; as,  $\text{Ca}^+$  denotes two positive charges. (3) To separate parts of a compound regarded as loosely joined; as,  $\text{CuSO}_4\cdot 5\text{H}_2\text{O}$ .  
 ○ denotes the benzene ring.  
 = indicates a double bond. Placed above a symbol or to its right above the line, it signifies two unit charges of negative electricity; as,  $\text{SO}_4^{--}$ , the negative ion of sulfuric acid, carrying two negative charges.  
 ≡ signifies a triple bond or negative charge.  
 :: indicates a double bond.  
 :: indicates a triple bond.  
 ( ) mark groups or radicals within a compound, as in  $\text{C}_6\text{H}_4(\text{CH}_3)_2$ , the formula for xylene which contains two methyl radicals ( $\text{CH}_3$ ).  
 ☐ or ☐ join separated atoms or groups in structural formulas, as in that for glucose:

- Give or form.  
 ⇨ Give, pass over to, or lead to.  
 ⇨ Forms and is formed from.  
 ↓ indicates precipitation of the substance.  
 ↑ indicates that the substance passes off as a gas.  
 ≡ or ≡ Is equivalent;—used in statements to show how much of one substance will react with a given quantity of another so as to leave no excess of either.  
 1, 2, etc., used initially in names, referring to the positions of substituting groups, attached to the first, etc., of the numbered atoms of the parent compound.  
 ☉ Every element is represented by a symbol consisting of the initial or the abbreviation of its name, or, sometimes, its Latin name (See ELEMENT, Table, in *Vocab*).

## IV. MATHEMATICS

### RELATIONS OF QUANTITIES

- + Plus; and; more;—indicating addition; as,  $a + b = c$ . Used also to indicate that figures have been omitted from the end of a number, or that the latter is approximately exact; as, the square root of 2 is 1.4142135+.  
 − Minus; less;—indicating subtraction; as,  $a - b = c$ . Used also in a similar manner to + to indicate approximate exactness.  
 ±, +, ±, or ± Plus or minus;—indicating that the number or quantity to which it is prefixed may have either of the signs + or −; as, the square root of  $4a^2$  is  $\pm 2a$ .  
 × Multiplied by; times; into; as,  $a \times b = ab$ ;  $6 \times 4 = 24$ .  
 ☉ Multiplication is also indicated by placing a raised dot between the factors (as,  $4 \cdot 5 \cdot 6 = 120$ ), or by writing the latter, when not numerals, one after another without any sign.  
 ÷ or : Divided by; as,  $a \div b$ ; that is,  $a$  divided by  $b$ ;  $6 \div 3 = 2$ .  
 ☉ Division is also indicated by writing the divisor under the dividend, with a line between, or by writing the divisor after the dividend, with an oblique line between; as,  $\frac{a}{b}$ ;  $\frac{36}{6}$ .  
 = Is equal to; equals; as,  $(a + b) \times c = ac + bc$ ;  $6 + 2 = 8$ .  
 ≠ or ≠ Is not equal to; as,  $a \neq b$ .  
 > Greater than; as,  $a > b$ ; that is,  $a$  is greater than  $b$ ;  $6 > 5$ .  
 < Is less than; as,  $a < b$ ; that is,  $a$  is less than  $b$ ;  $3 < 4$ .  
 ~ or ~ Difference.  
 ∝ Varies directly as; is directly proportional to; as,  $a \propto b$ .  
 ∴ Is to; the ratio of.  
 ∴ As; equals.  
 ∴  $\frac{a}{b} = \frac{c}{d}$  is now the preferred way of writing geometrical proportions.  
 ∴ Therefore.  
 ∴ Since, or because.  
 ∞ Infinity.  
 0 Zero; also, infinitesimal; a quantity less than any assignable value.  
 ∠ Angle; the angle; as,  $\angle ABC$ .

Right angle; as,  $\angle ABC$ .

The perpendicular; perpendicular to; as, draw  $AB \perp CD$ .

Parallel; parallel to; is parallel to; as,  $AB \parallel CD$ .

○ or ○ Circle; circumference;  $360^\circ$

○ Arc of a circle; arc.

△ Triangle; as,  $\triangle ABC$ .

□ Square; as,  $\square ABCD$ .

▭ Rectangle; as,  $\square ABCD$ .

√ or √ Root;—the radical sign, indicating, when used without a figure placed above it, the square root; as,  $\sqrt{4} = 2$ ;  $\sqrt[3]{4^3} = 4$ .

To denote any other than the square root, a figure (the index), expressing its degree, is placed above the sign; as,  $\sqrt[3]{a}$ ,  $\sqrt[4]{a}$ , etc.; that is, the cube root, fifth root, etc., of  $a$ .

☉ The root of a quantity is also denoted by a fractional index at the right-hand side of the quantity and above it, the denominator of the index expressing the degree of the root; as,  $a^{\frac{1}{2}}$ ,  $a^{\frac{1}{3}}$ , etc.; that is, the square, cube, and fifth roots, respectively, of  $a$ .

Vinculum } Indicate the quantities to which they are applied, or which are enclosed by them, are to be taken together.  
 Parentheses }  
 Brackets }  
 Braces }

$f$  or  $F$  Function; function of; as,  $y = f(x)$ ; that is,  $y$  is, or equals, a function of  $x$ .

☉ Other letters or signs are frequently used to indicate functions, as,  $\phi$ ,  $\psi$ ,  $\pi$ , and the like.

$d$  Differential, as,  $dx$ ; that is, the differential of  $x$ .

$\delta$  Variation, as,  $\delta x$ ; that is, the variation of  $x$ .

$\Delta$  Finite difference.

$D$  Differential coefficient; derivative.

☉ The letters  $d$ ,  $\delta$ ,  $\Delta$ ,  $D$ , and sometimes others, prefixed to quantities, are variously employed, by different mathematicians, to denote that the differentials, variations, finite differences, or differential coefficients of these quantities are to be taken; but the ordinary significations are those given above.

∫ Integral, integral of, — denoting that the following expression is to be integrated; as,  $\int 2x dx = x^2$ ; that is, the integral of  $2x dx$  is  $x^2$ .

☉ If integration is to be performed more than once, the sign is repeated once for each time. For a number of times greater than three, an index is commonly written at the right hand above. The variable, with respect to which the integral is taken, is sometimes indicated by writing the letter designating it at the right hand below, as,  $\int \phi$ ; that is, the integral of  $\phi$  with respect to  $x$ .

∫ or ∫ denotes that the integral is to be taken between the value  $b$  of the variable and its value  $a$ .  $\int^a$  denotes that the integral ends at the value  $a$  of the variable, and  $\int_b$  that it begins at the value  $b$ . These forms must not be confounded with that indicating repeated integration or with that indicating the integral with respect to a particular variable.
